Demo walkthrough script

Use this while recording. Target **3.5–4.5 minutes** (assignment: 3–5). Open the **live Streamlit URL** (your **.streamlit.app* link), full screen, 1080p. Hide bookmarks. Do not record localhost.

0. Before you hit record

- Reboot the Streamlit Cloud app and hard-refresh the browser.
- Confirm Ask now caption shows **groq:openai/gpt-oss-20b** (secrets saved). If it says local_retriever, still demo it and say numbers come from facts.json.
- GitHub: https://github.com/howsthejoshi/pdf-artifact-creator
- Paste box ready for three questions (below).

Keep these on a second screen / notes app

Ask 1 — Which loan type has the highest default rate?

Ask 2 — What is the portfolio default rate?

Ask 3 — What will GDP be next year?

Account tab uses the prefilled high-PD account_id — do not hunt IDs in Ask.

Run of show

Clock	Tab	What you show
0:00–0:20	Portfolio	Set the scene — KPIs only
0:20–1:15	Portfolio	Charts + one filter (uncheck Mortgage, restore)
1:15–2:05	Account	PD, band, bureau / repay / collections drivers
2:05–3:05	Anomalies	Trigger / FP / FN + Dismiss (or Confirm)
3:05–4:20	Ask the Portfolio	Two grounded answers + one decline
4:20–4:45	Portfolio	Close on the book view

If you run long, drop Ask 2 — keep GDP decline. If Groq is slow, wait; do not double-click Ask now.

1. 0:00–0:20 · Open and set the scene

CLICK — Nothing. Camera on the Portfolio tab. Five KPI tiles visible.

SAY — "This is a credit-risk monitor on 10,000 customers and 14,685 loans. Observed default is 16.1%, exposure about 601 million dollars. I'll show the portfolio view, one account, the anomaly queue, and Ask the Portfolio — both AI features are live on this hosted app."

2. 0:20–1:15 · Portfolio + one filter

CLICK — Hover Accounts, Customers, Exposure, Observed default, Mean predicted PD.

SAY — "Morning view: book size, default rate, and average predicted PD. Default by loan type — Mortgage is the weakest at 24.6% versus Auto around 14%. Exposure by region. The heatmap is employment times product. Risk bands are the model scores."

CLICK — Sidebar Loan type → uncheck Mortgage. Pause until the account count drops.

SAY — "Filters apply to every tab. Taking Mortgage out cuts accounts and exposure immediately."

CLICK — Check Mortgage again so the full book is back.

3. 1:15–2:05 · Account view

CLICK — Tab Account. Leave the prefilled high-PD account_id.

SAY — "Account lookup. This ID is a high predicted PD. You see PD, risk band, whether it already defaulted, and loan amount."

CLICK — Scroll to Key drivers, then the three boxes (bureau / repay / collections).

SAY — "Drivers are versus the book median — bureau DPD and utilisation, missed EMIs, collections. An analyst would open this before calling the customer. I won't chase a single ID in Ask; that's this tab on purpose."

4. 2:05–3:05 · Anomalies (AI feature 2)

CLICK — Tab Anomalies. Open the expander "What triggers a flag…" if it is closed.

SAY — "Second AI feature: anomaly detection. Trigger is IsolationForest plus peer z-scores on bureau DPD, write-offs, missed EMIs. False positive: a large mortgage with a one-off utilisation spike still paying on time. False negative: a two-month-old loan with almost no history. Human step is this queue."

CLICK — Glance the table. Record a decision → first account. Read the reason line (short).

CLICK — Dismiss — false positive (or Confirm). Wait for the success toast.

SAY — "I dismiss this as a false positive. The decision is stored; open items stay on the list. That is the human-in-the-loop."

5. 3:05–4:20 · Ask the Portfolio (AI feature 1)

CLICK — Tab Ask the Portfolio. Point at the engine caption.

SAY — "First AI feature: LangGraph over dashboard facts. Groq only sees grouped rates, not raw customer rows. Generate, then a number check. If a figure isn't in the tables, we decline or fall back."

CLICK — Sample button Which loan type has the highest default rate? (or paste + Ask now). Wait.

SAY — "Mortgage, about 24.6%, with the count and exposure. Source is by loan type — that matches the bar chart we saw."

CLICK — Paste What is the portfolio default rate? → Ask now.

SAY — "16.1 percent, 2,364 defaults on 14,685 accounts. Same KPI as the header."

CLICK — Paste What will GDP be next year? → Ask now.

SAY — "Declined. The graph will not invent a macro forecast. That's the false-positive control: no number if it isn't in facts.json. Human step: I still check the Portfolio tab before I would change policy."

6. 4:20–4:45 · Close

CLICK — Tab Portfolio so the last frame is the book.

SAY — "That's the working monitor: portfolio and account views, anomaly review with confirm or dismiss, and grounded Ask the Portfolio on the hosted link. Code is on GitHub; this Streamlit app stays live for the review window."

Stop recording. Export 1080p. Loom or YouTube **unlisted**.

Submission email (three links, no zip)

1. Hosted dashboard — your **https://<name>.streamlit.app** URL (must stay live 14 days).
2. GitHub — https://github.com/howsthejoshi/pdf-artifact-creator
3. Demo video — Loom or YouTube unlisted URL from this recording.

If something breaks while recording

- **Ask now missing** — you are not on the fourth tab. Click Ask the Portfolio.
- **Oven / hang** — you are not recording a build. Use the already-running Cloud app.
- **Groq slow** — pause and wait; one click only.
- **Filter empty** — restore all loan types / regions in the sidebar.
- **Went over 5:00** — cut hover on KPIs and Ask 2; keep GDP decline.
